

Camassia leichtlinii – Great Camas is a wonderful perennial species that provides an essential accent to any flower bed or landscaping project. With deep purple blue petals and stunning yellow filaments this perennial will stand out and bring applause from any visitor. This specimen will grow 2–3' tall with a raceme of blooms from April through May. When we see Camas emerge and begin flowering we know that spring has truly arrived. Great Camas will be most comfortable in a sunny well drained location. As the bulb grows the plant will send up more flower stalks each year. It is a great compliment to many other flowering perennials and is attractive to bees and other pollinators.

Lilium columbianum – Columbia lily is a bulb perennial that emerges from dormancy with whorled leaves and will grow quickly to 3'. The bright-orange petals are dappled with deep-red to purple spots and are very exquisite blooming from May through August. The petals nod on the stem

and the tepals curve backwards as the flowers age. This specimen is found in meadows, thickets and open forest clearings. It is a perfect accent for flower beds with partial shade and well drained soil. It is quickly found by pollinators and adds a certain elegant beauty to landscaping and gardening projects.

Lupinus polyphyllus – Large leaved lupine is a fantastic perennial that will grow about 3' tall with a plethora of lavender blooms. This herb will branch from a woody rhizome and has palmately compound leaves with 10–17 leaflets per leaf. The pea like flowers will be in clusters up to 40 cm long, with blooms persisting from June through August. This plant will make a fantastic addition to a sunny moist to wet habitat. It is easy to cut back, divide and move around the landscape. It is a delight even in rainy weather as the leaves hold water droplets in perfect circles at the center of the leaflet. The bees and butterflies will also thank you for adding this plant to your garden.

Valeriana sitchensis – Sitka valerian is a stunning addition to restoration sites and home landscapes alike. This fibrous-rooted perennial forms a stout branched woody rhizome like stem-base that will be between 1–3' tall. The leaves are opposite,

coarsely toothed divided pairs along the stem. This specimen boasts delicate white to pale pink blooms lasting from June through August, with a heavy sweet scent. The blooms form a dense, terminal, flat cluster that sits on the top of the plant. Although found in moist meadows and thickets, it will be comfortable in a sunny to partial shade location with well drained soil. The prolific blooms attracted bees and other pollinators.
